

Suraj Khonde

Full Stack (MERN) Developer

✉ surajrkhonde@gmail.com 📞 7348887772 📁 Portfolio 🌐 GitHub 🌐 LinkedIn

Professional Summary

Software Engineer with 3+ years of experience building and maintaining production web applications using the MERN stack. Delivered end-to-end features across React, Node/Express, and MongoDB, with a strong focus on performance, reliability, and clean, maintainable code. Improved user experience through query optimization and Redis caching, strengthened security with JWT-based authentication, and optimized media delivery using AWS S3 pre-signed URLs to reduce backend load and bandwidth. Comfortable owning work from requirements to release while collaborating closely with QA, product, and clients.

Experience

Software Engineer – Advento Technologies, Hyderabad Sep 2025 – Jan 2026

- Delivered backend features for a banking virtual assistant that supports high-volume customer conversations and smooth escalation to human support, improving overall resolution experience.
- Built a reliable **bot-to-agent handoff** flow that transfers the customer along with conversation context, helping agents start faster and reducing repeated questions.
- Designed and maintained customer queue and agent routing logic, ensuring fair assignment, minimal waiting, and stable handling during peak traffic.
- Improved operational reliability by adding background workflows and safeguards (retries, timeouts, monitoring hooks) to handle follow-ups, session cleanup, and failure recovery.

Full Stack (MERN) Developer – Technoloader Pvt Ltd, Jaipur May 2024 – Jul 2025

- Took ownership of production reliability by triaging tester/customer-reported issues end-to-end, identifying root causes across UI/API/DB, and shipping fixes quickly to keep client flows stable.
- Minimized app crashes by 30% by implementing centralized error handling in Express middleware and React boundaries, ensuring smoother user flows.
- Reduced bandwidth and backend load by moving media delivery to AWS S3 with pre-signed URLs, enabling direct client uploads/downloads instead of proxying files through the backend.

Full Stack (MERN) Developer – Avisirah Technologies, Hyderabad Mar 2022 – Feb 2024

- Owned end-to-end delivery of MERN features (React UI + Node/Express APIs + MongoDB), taking work from requirement breakdown to deployment with clean, production-ready code.
- Designed a secure authentication flow using JWT access tokens + refresh tokens, bcrypt password hashing, and RBAC (role-based permissions) to protect privileged routes and sensitive actions.
- Optimized performance by implementing route-based code splitting, lazy loading, and bundle cleanup, cutting build size by ~55% and improving initial load time.
- Improved frontend maintainability by modularizing UI into reusable React components and shared utilities, reducing duplicate code and speeding up feature delivery.

Equity Research Analyst – Non-Core Roles (2019–2022)

Technical Skills

Languages: JavaScript (ES6+), TypeScript

Frontend: React.js, Next.js, Redux Toolkit, React Query, TailwindCSS

Backend: Node.js, Express, REST APIs, Socket.IO (WebSockets), Auth (JWT, bcrypt), Validation (Joi)
Background Jobs (Bull/BullMQ)

Databases: MongoDB (Mongoose), MySQL, Redis (caching & sessions)

DevOps & Tools: Docker, AWS (EC2/Lambda), CircleCI (CI/CD), PM2, Swagger/OpenAPI, Git, Postman

Testing: Jest

Projects

Nexus [GitHub](#) | [Project Link](#)

React 18, Redux Toolkit, Node.js, TypeScript, MongoDB, Redis, Socket.IO, BullMQ, JWT, Joi, Cloudinary, PM2

- Designed real-time messaging and in-app notifications using persistent connections to deliver low-latency updates without client polling.
- Built a durable background job pipeline for fan-out notifications, media workflows, and email delivery—added retries/backoff to keep tasks reliable during restarts or transient failures.
- Implemented horizontal scaling for real-time events using Redis pub/sub + Socket.IO adapter, ensuring consistent event delivery across multiple server instances behind a load balancer.
- Improved operational stability with production hardening: structured logging, config validation, centralized async error handling, graceful shutdown, and PM2 clustering for better throughput and safer deployments.

FlickFlair [GitHub](#) | [Project Link](#)

React.js, JavaScript, TailwindCSS, Node.js, Express.js, REST API, MongoDB, Redis

- Built an IMDb-style movie discovery & review web app with a curated poster feed, trailer playback, and rich movie detail pages (cast/crew, writers, genres/types)
- Delivered a polished UX with scroll-driven browsing, interactive cast/crew detail cards, and a dark/light theme experience (default dark for visual comfort)
- Implemented an authenticated rating/review flow so only logged-in users can post feedback, improving trust and preventing anonymous spam.

Education

B.E. Mechanical Engineering – VTU, Belagavi (2018)
